Reason For Allowance

For claims 2-6, the closest prior art Kersley et al (US 2003/0172177) discloses where different packets types are generated and used to test a device. The second closest prior art Buechler et al (US 2002/0190356) discloses where flags are used to mark if test instructions used to test a measuring device are currently being used and if a test has been completed. While Buechler teaches the concept of using flags to see if a test on a measuring device is being done / completed there is no motivation to apply these teachings to a packet type produced to test a network device, in either Kersley or Buecheler. Therefore, the prior art fails to disclose by either anticipation or combination the following:

For claim 2, A method for use in verification of a device
comprising:

providing a plurality of packet classes;

providing a flag, which may be of a first or a second state, for each of the plurality of packet classes;

generating a packet;

if the flag of the packet class of the generated packet is in the first state, testing the device;

if the flag of the packet class of the generated packet is in the first state, changing the flag of the packet class of the generated packet to the second state.

For claim 3, A method for use in verification of a device comprising:

providing a plurality of packet classes;

providing a flag, which may be of a first or a second state, for each of the plurality of packet classes;

generating a packet;

if the flag of the packet class of the generated packet is in the first state, testing the device;

if the flag of the packet class of the generated packet is in the second state, not testing the device.

For claim 4, A method for use in verification of a device comprising:

providing a plurality of packet classes;

providing a flag, which may be of a first or a second state, for each of the plurality of packet classes;

generating a packet;

if the flag of the packet class of the generated packet is in the second state, not testing the device.

For claim 5, A method for use in verification of a device comprising: (a) providing a plurality of packet classes;

(b) providing an injection flag, which may be of a first or a second state, for each

of the

plurality of packet classes;

(c) generating a packet;

(d) if the injection flag of the packet class of the generated packet is in the second state, not testing the device;

(e) if the injection flag of the packet class of the generated packet is in the first state, testing the device and setting the injection flag of the packet class of the generated packet to the second state.
